

Extended Analysis: Seasonality, Cold Chain, Vulnerability & Scenarios

Commodity Flow Survey 2017. SCTG 03-07 (produce, dairy, meat, grain, prepared food). All estimates design-weighted. Extends the base food miles analysis with four new dimensions of NYC's fresh food supply chain.

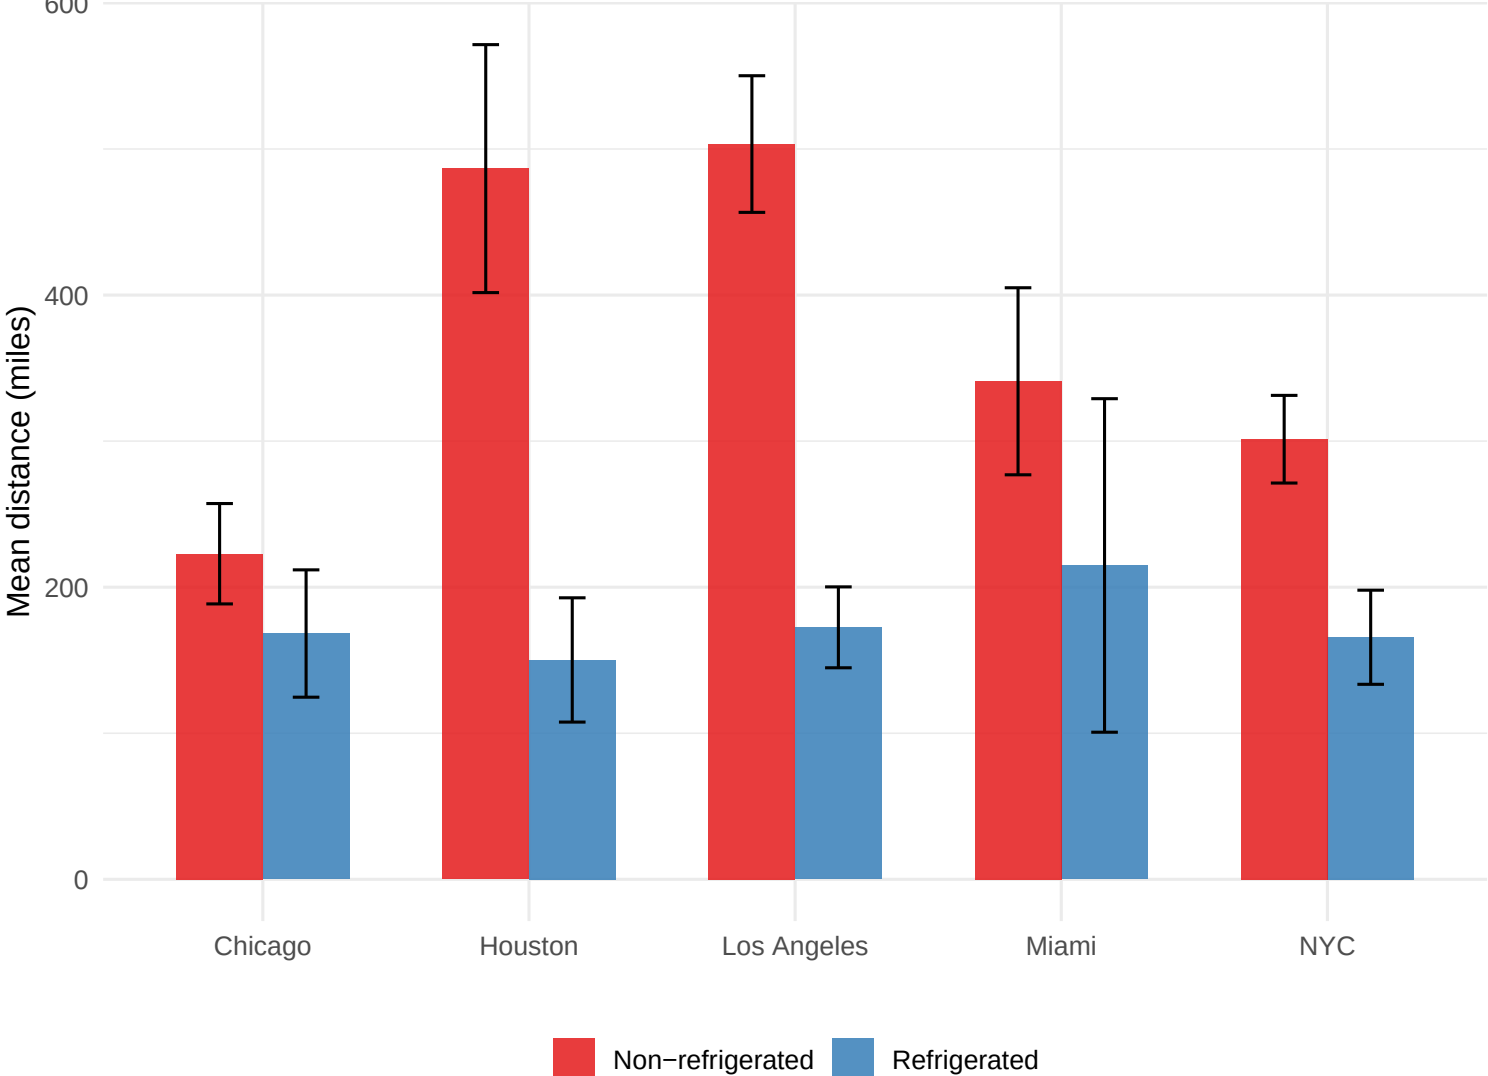

A. Seasonal Food Miles: Does Winter Lengthen the Supply Chain?

Weighted mean shipment distance by quarter. Ribbons = 95% CI. NYC shows modest seasonal shift.

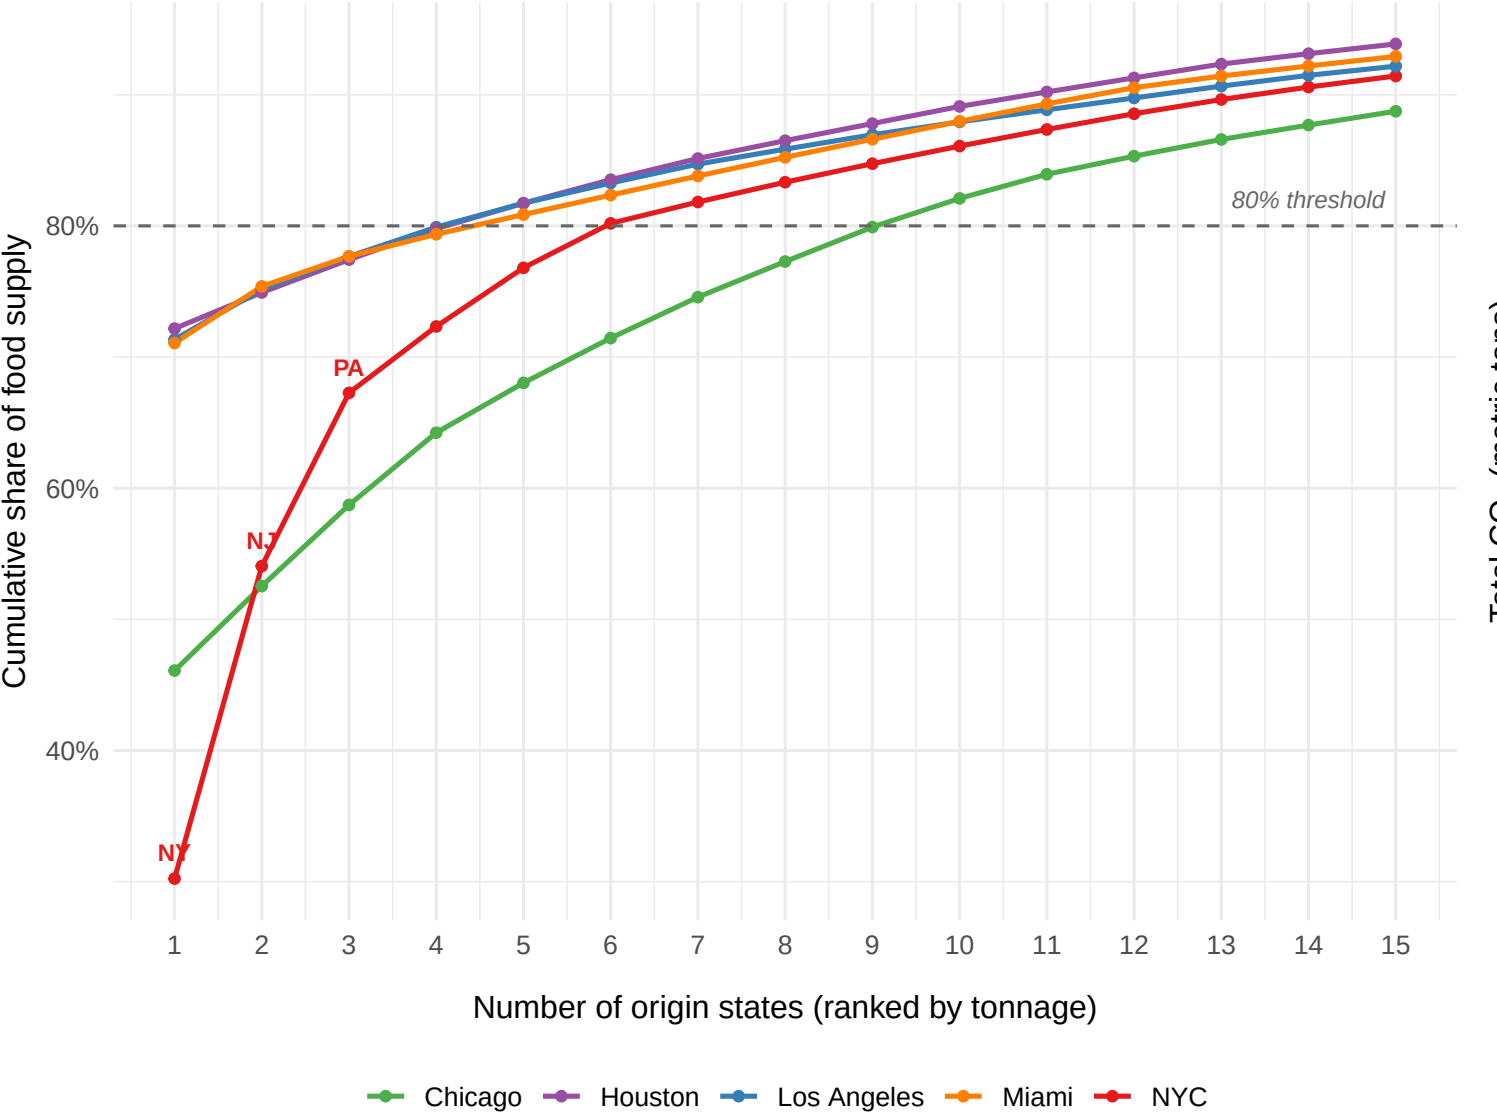

B. Cold Chain: Refrigerated Food Travels Farther

Weighted mean distance by temperature control status. Error bars = 95% CI.

C. Supply Chain Vulnerability: Origin Concentration

Cumulative share of weighted food tonnage by number of origin states. Fewer states = more concentrated = more vulnerable.

D. Mode Substitution: What-If Scenarios for NYC Food Carbon

Counterfactual CO2 reduction from shifting transport modes. Even small shifts in air/parcel have outsized impact.
